

Voting System

A simple **Voting System developed using Python**. This project demonstrates the basic concepts of Python programming by creating a system where registered voters can participate in an election and the results can be calculated and displayed.

About the Project

The Voting System is a Python-based project designed to simulate a basic election process. It allows registered voters to cast their votes for available candidates and calculates the voting results.

This project was created as a learning project to practice Python programming concepts such as conditional statements, loops, functions, variables, and basic data handling.

Features

-  Allows registered voters to cast votes
-  Supports multiple candidates
-  Counts votes for each candidate
-  Determines the candidate with the highest number of votes
-  Handles invalid voting choices
-  Displays voting results
-  Developed entirely in Python

Technologies Used

- **Python 3**
- Python built-in functions
- Basic Python data structures

How to Run

1. Install Python

Make sure **Python 3** is installed on your computer.

You can check your Python version using:

```
python --version
```

2. Clone the Repository

Clone this repository using:

```
git clone https://github.com/shahinam23/voting-system.git
```

Then move into the project directory:

```
cd voting-system
```

3. Run the Program

Run the Python file using:

```
python your_file_name.py
```

Replace `your_file_name.py` with the actual name of your Python file.

Concepts Used

This project helped me practice several fundamental Python concepts, including:

- Variables
- Input and output
- `if-else` statements
- Loops
- Functions
- Lists and dictionaries
- Conditional logic
- Basic data processing

Purpose

The main purpose of this project is to strengthen my understanding of Python programming by applying programming concepts to a practical problem.

Future Improvements

Some possible improvements for future versions include:

- Adding a graphical user interface (GUI)
- Adding an administrator/login system
- Storing votes in a database
- Adding voter authentication
- Generating detailed election reports
- Preventing duplicate voting
